ABOUT US

Egebant was established in Karaköy in 1969. With its sustainable solutions, Egebant prioritises customer satisfaction at the highest level and aims to be the permanent solution partner of its customers and stakeholders. In line with this mission, it has been collaborating with globally recognised brands for many years.

Accordingly, Egebant brings the products of globally strong brands such as 3M, Honeywell, Klingspor, Naxoflex, Dynabrade, and Sicad to the Turkish market.

Guided by its core values of trustworthiness, innovation, sincerity, courage, and participation, Egebant builds long-term, trust-based relationships with its customers and stakeholders while developing flexible, tailored solutions for them.

By leveraging its manufacturing experience, which it has gained through providing services to many industry-leading brands—from the automotive sector to home appliances—Egebant continues to expand its product range with its brands, Egebant and Sander, while making investments in line with market needs.

With over 650 employees, more than 50 active sales specialists, and a widespread dealer network across Turkey, Egebant operates manufacturing facilities in Şekerpınar, Kocaeli, and Şanlıurfa. The company exports to more than 30 countries across three continents, primarily in Europe, offering a diverse range of products for various industries.

Through its customer-centric approach, Egebant conducts research and development (R&D) activities to create innovative solutions that generate value for all its customers and stakeholders.

As part of its environmental policy, Egebant effectively manages the inputs of its production processes and energy resources, developing methods to increase energy efficiency, reduce waste, and prevent pollution.

With a commitment to environmental sustainability, the company has launched a Zero Waste Project in its facilities, ensuring waste separation at the source to minimise environmental risks. Additionally, Egebant is expanding its expertise in green energy through its recycling facilities.

Moreover, to contribute to the reduction of emissions and the development of a renewable energy system, Egebant plans to generate a significant portion of the energy it consumes at its Şanlıurfa production facility through a rooftop solar power plant.

For 56 years, Egebant has been successfully growing its brands and reputation with the vision of becoming a global leader, continuously producing sustainable solutions and creating lasting value for all its stakeholders.

Finding the Right Gloves is

Now Effortless!

Easily find the gloves you are looking for by using the Glove Selector on **egebant.com.tr**, powered by an algorithm that simplifies glove selection for various industries and needs.

The best protection is in your hands with the fastest selection!

PU-Coated Cut-Resistant Gloves

General Properties

It is produced by coating PU on a thin and heat-resistant HPPE fiber and polyester blend lining. TDM 100 provides D level cut resistance according to ISO 13997 test. It provides a better grip on dry and slightly oily parts compared to bare hands.It is suitable for working with hot parts (100 °C contact temperature) as well as for applications where protection against the risk of cuts is required.

Areas of Usage

Metalworking, working with heavy parts, working with sheet metal, production and assembly lines, steel wire applications.

Nitrile Foam-Coated Cut-Resistant Gloves

General Properties

It is produced by coating Foam Nitrile on a cut, abrasion and heat-resistant, HPPE fiber and polyester blend lining. TDM 100 provides E level cut resistance according to ISO 13997 test. It makes it easier to hold dry and less oily parts compared to holding with bare hands. It is suitable for working with hot parts (100 °C contact temperature) as well as for applications where protection against the risk of cuts is required.

Areas of Usage

Metalworking, working with heavy parts, working with sheet metal, production and assembly lines, steel wire applications.

Gauge

Thickness 1,00 mm

6,7,8,9,10,11

Areas of Usage

It is made by double-layer knitting of reinforced cutresistant continuous filament fiber and a specially designed cut-resistant fiber. This provides extra durability in cut protection. It offers high grip and excellent mobility. General handling, working with metal pieces, working with sheet metal materials, assembly and production lines.

Glove Standards

Personal Protective Equipment Regulation (EU) 2016/425

The PPE Regulation classifies personal protective equipment (PPE) into three categories based on risk levels:

Category I: PPE Protection Against Minor Risks

Includes gloves and sleeves designed to protect against minimal risks, such as superficial mechanical injuries and cleaning-related hazards. Manufacturers are allowed to self-test and certify their products.

Category II: PPE Protection Against Moderate Risks

Hand and arm protection designed to safeguard against cuts, abrasions, punctures, and tears. This category of products must undergo independent testing and be certified by an accredited notified body.

Once approved, the product will receive a CE marking from the notified body. In the EU, no PPE can be sold or used without the CE marking. The name and address of the notified body issuing the CE marking must be included in the user instructions provided with the product. Performance must be continuously monitored through testing.

Category III: PPE Protection Against Fatal or Irreversible Injuries

PPE in this category involves risks that can lead to very serious consequences, such as death or irreversible harm to health, including exposure to chemicals, hazardous biological substances, extreme temperatures, and cuts caused by chainsaws. PPE must undergo independent testing and certification in the same manner as Category II products. The quality assurance system used by the manufacturer must also be independently inspected, and the identification number of the notified body must appear next to the CE mark in the user instructions.

Continuous monitoring of performance and production processes should be carried out through product testing and factory inspections.

EN ISO 21420:2020

General Requirements for Protective Gloves

Most types of protective gloves must meet the following general requirements:

- Glove construction
- Ergonomics
- Dexterity
- Harmlessness
- Product marking and packaging information
- Sizing
- Water vapor transmission and absorption
- Electrostatic properties

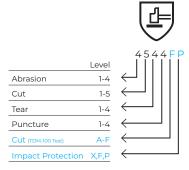

EN 388:2016

Protection Against Mechanical Risks

The EN 388:2016 standard applies to protective gloves against mechanical risks. This standard is used to determine the capacity of certain types of gloves to provide protection against abrasion, cuts, tears, and punctures. It classifies and defines the resistance levels of gloves against these hazards.

- **a.** Abrasion Resistance: Based on the number of cycles required to wear through the glove material.
- **b.** Cut Resistance: Based on the number of cycles required to cut through the glove at a fixed speed.
- **c.** Tear Resistance: Indicates the force required to tear the glove.
- **d.** Puncture Resistance: Specifies the force needed to puncture the glove.
- **e.** Cut Resistance (ISO 13997 Test Method) The force required to cut a sample using a specific cutting machine under defined conditions.
- **f.** Impact Protection:Based on measured energy and force transmission when the glove is subjected to an impact load.

EN 407:2004

EN 407:2004

Protection Against Thermal Hazards

Scope

This standard determines the level of protection a glove provides against heat and flames. It plays a crucial role in selecting gloves for workers exposed to various heat sources and flames. The heat and flame pictogram is accompanied by a six-digit performance rating, representing the glove's resistance levels under specific thermal conditions.

The 'Heat and Flame' symbol includes six performance criteria:

- a. Resistance to Flammability (Performance Level: 0 4)
- **b.** Contact Heat Resistance (Performance Level: 0 4)
- **c.** Convective Heat Resistance (Performance Level: 0 4)
- **d.** Radiant Heat Resistance (Performance Level: 0 4)
- e. Resistance to Small Splashes of Molten Metal (Performance Level: 0 4)
- **f.** Resistance to Large Splashes of Molten Metal (Performance Level: 0-4)

Glove Standards

EN 511

Protection Against Cold

Scope

This European standard regulates the manufacture and sale of protective gloves resistant to thermal cold, cold air, and water. It applies to all gloves designed to protect hands against convective and contact cold down to -50°C.

Gloves providing protection against cold are tested based on three performance criteria, with results displayed under the cold protection pictogram:

- a. Resistance to Convective Cold (Performance Level: 0 4)
- **b.** Resistance to Contact Cold (Performance Level: 0 4)
- c. Water Penetration Resistance (Performance Level: 0 or 1)

EN 374-2

Protection Against Chemicals and/or Microorganisms

The EN 374-2 standard determines a glove's ability to protect against liquid and gas permeability. This is particularly important for users handling hazardous liquids or gases, as it helps assess whether the glove can effectively prevent substance penetration. A glove's permeability resistance plays a critical role in protecting the user's skin from potential hazards.

The permeation performance of gloves defines their resistance to chemicals over a specific period. Based on EN 374-1 and EN 374-2 standards, gloves are classified according to their permeability performance, indicating how long they can protect against a specific chemical.

The EN 374-4:2013 standard evaluates how long gloves can maintain their protective properties when exposed to chemical substances. This test measures the glove's resistance duration and its ability to retain protection over time. This information is essential in determining how frequently gloves should be replaced.

The EN ISO 374-5:2016 standard assesses a glove's ability to protect against microorganisms. It measures the glove's effectiveness in reducing the number of microorganisms on its surface and interior. This is particularly crucial for users exposed to biological hazards, as it indicates how well the glove can protect against potential infections.

Requirements	Marking
Permeation resistance (EN 374-2): The penetration time must be \geq 30 minutes for at least six chemicals listed in the table (EN 16523-1).	EN ISO 374-1/ Type A AJKLOT
Permeation resistance (EN 374-2): The penetration time must be ≥ 30 minutes for at least three chemicals listed in the table (EN 16523-1)	EN ISO 374-1/Type B
Permeation resistance (EN 374-2): The penetration time must be ≥ 10 minutes for at least one chemical listed in the table (EN 16523-1)	EN ISO 374-1/Type C
For gloves providing protection against bacteria and fungi.	EN ISO 374-5
For gloves providing protection against bacteria and fungi.	EN ISO 374-5 WIRUS

EN 16350

EN 16350

Test Standard for Electrostatic Properties

The EN 16350 standard defines the requirements and test methods for the electrostatic properties of protective gloves. It outlines additional requirements for gloves worn in environments where flammable or explosive atmospheres are present or may occur. This standard also provides a performance, marking, and information test method for protective gloves designed to dissipate electrostatic energy and minimize explosion risks.

It ensures that gloves protect operators in hazardous and explosive environments by preventing electrostatic discharge and its consequences. To ensure that electrostatic charges do not accumulate on the glove and are effectively transferred to the rest of the clothing for dissipation, the glove must have a sufficient level of electrical conductivity.

According to this standard, the glove's vertical electrical resistance (its ability to prevent electrostatic charge movement) must be less than 108 ohms. The lower the resistance value, the more conductive the glove, and thus, the lower the risk for the operator.

Glove Size and Measurement Chart

Glove Size	Hand Circumference (mm)
6	152
7	178
8	203
9	229
10	254
11	279

Glove Coating Types

Polyurethane Coating

- 1. Polyurethane is a thin and breathable coating that is also used in synthetic leather production.
- 2. It can quickly dissipate heat from the hand, helping to reduce sweating.
- **3.** It is used in tasks where high fingertip sensitivity is essential.

Foam Nitrile Coating

- 1. Foam nitrile coating is oil-resistant due to the nitrile it contains.
- 2. Its porous structure allows breathability and makes it easier to grip oily parts.
- **3.** The relatively thick structure of foam nitrile coating enhances comfort when handling heavy parts, acts as a cushion for the hand, and reduces pressure force.

Nitrile Coating

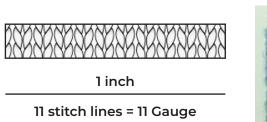

- 1. Thanks to its non-porous coating structure, it prevents mineral oils, water, and certain chemicals from penetrating the glove. For this reason, this type of coating is preferred in wet and oily work environments.
- 2. It can be used in dry, lightly oiled, or oily work environments.

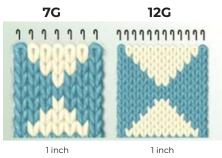

Double Coating (Double-Dipped Nitrile Coating)

- 1. The first layer prevents the penetration of oil and liquids, while the second layer enhances grip, making it easier to hold oily or wet parts without slipping.
- 2. Suitable for use in oily and wet work environments.

GAUGE (Knitting Tightness)

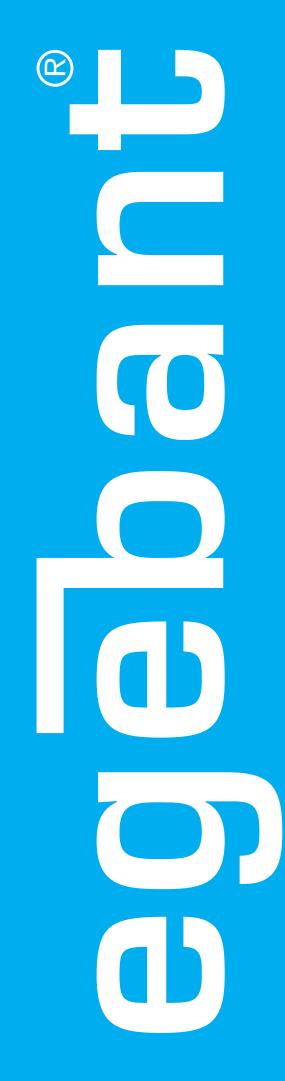

- 1. The gauge number represents the knitting density and indicates the number of stitches per inch on the glove.
- 2. As the gauge number increases, the knitting tightness also increases. Common gauge numbers include 7, 10, 13, 15, 18, and 21.
- 3. Thin and high-durability gloves can be produced using high-gauge knitting machines.

Yarns

Natural, comfortable, and flexible Cotton Flexible, high durability, synthetic fiber Polyester Polyamide (Nylon) Flexible, high durability, highly comfortable synthetic fiber HPPE/UHMWPE Cut-resistant synthetic fiber Aramid / P.
